The "Oracle Vulnerabilities Unpatched" report shows all unpatched vulnerabilities in Oracle products. These vulnerabilities are normally patched through Oracle Critical Patch Updates (CPU). For Oracle Database and Oracle Application Server, the vulnerabilities are determined by the version number and status of the CPU. For Oracle E-Business Suite, vulnerabilities are tested based on source code version. The report is sorted by Critical Patch Update (month/year) and Oracle product. The vulnerability identifier (e.g., DB01) is from the Oracle Critical Patch Advisory. The affected Oracle component is included, but may not always be present as Oracle sometimes does not provide this information in the CPU.
